Risk factors for upstaging from DCIS to invasive cancer in final surgical specimen

	Oxford	LoE
Higher risk		
▪ DCIS without microcalcification in core needle or vacuum biopsy		3b
▪ Microcalcification $\geq 11,5$ mm		3b
▪ Presentation as tumor in MRI		3b
▪ Increased Ki-67 ($\geq 20\%$)		3b
▪ PR negative		3b
▪ High peak contrast enhancement on MRI		3b
▪ Irregularly shaped, non-circumscribed, heterogeneous or margin-enhancing tumors with intratumoral high signal intensity or peritumoral edema on MRI		3b
▪ Biopsy technique: diagnosis by core needle biopsy versus vacuum biopsy (smaller sampling volume)		3b
▪ High platelet-lymphocyte ratio		3b
Lower risk		
▪ Removal $\geq 90\%$ of the microcalcifications by vacuum biopsy		3b

Original Investigation

Breast Cancer Mortality After a Diagnosis of Ductal Carcinoma In Situ

Narod A. et al.: JAMA Oncol. 2015 Oct;1(7):888-96

- **108.196 patients from the SEER data base,**
- **retrospective analysis,**
- **breast cancer specific mortality 3,3 %,**
- **results:**
 - risk is greater for young and black women,
 - the risk of dying from breast cancer is increased after ipsilateral invasive recurrence [HR 18.1 (95% CI 14.0-23.6); $P<0.001$] or contralateral invasive recurrence [HR 13.8 (95% CI 11.5-16.6); $P<0.001$], but not after a DCIS recurrence (ipsilateral or contralateral),
 - the use of radiotherapy reduced the risk of developing an ipsilateral invasive recurrence from 4.9% to 2.5% but did not reduce breast cancer-specific mortality at 10 years (0.9% vs 0.8%).

Association of a Diagnosis of Ductal Carcinoma In Situ With Death From Breast Cancer

Giannakeas V, Sopik V, Narod SA. JAMA Netw Open. 2020 Sep 1;3(9):e2017124

- 144,524 women treated for DCIS, 1,540 women died of breast cancer,
- cohort study included data for women who had first primary DCIS diagnosed between 1995 and 2014 from the SEER registries database (use of ET is not reported),
- retrospective analysis,
- results:
 - standardized mortality ratio for death from breast cancer among women with DCIS was 3.36 (95% CI, 3.20-3.53),
 - risk is greater for young and black women,
 - 4,502 (3.1%) ipsilateral invasive recurrences, resulting in a 20-year actuarial risk of 13.9%,
 - 5,527 (3.8%) contralateral invasive breast cancers, resulting in a 20-year actuarial risk of 11.3%,
 - women with DCIS had a 3-fold increased risk of death from breast cancer compared to women without DCIS.

1. Giannakeas V, Sopik V, Narod SA. et al. Association of a Diagnosis of Ductal Carcinoma In Situ With Death From Breast Cancer. JAMA Netw Open. 2020 Sep 1;3(9):e2017124. doi: 10.1001/jamanetworkopen.2020.17124.

Gute klinische Praxis (GKP)

Exzision (BEO oder Mastektomie) ist die therapeutische Basis für die Behandlung des DCIS.

Die adjuvante Therapie (Strahlentherapie, endokrine Therapie) muss mit der Patientin auf der Basis einer Risiko-Nutzen-Bewertung individuell erörtert werden.

DCIS

adjuvante Strahlentherapie

	Oxford		
	LoE	GR	AGO
Radiotherapie nach:			
▪ Brusterhaltender Operation (BEO) ; (gesamte Brust, WBI)	1a	A	++
▪ Mastektomie	2b	B	--
Durchführung der Radiotherapie:			
▪ Konventionell fraktionierte Radiotherapie (50 Gy in 25 Frakt.)	1a	A	+
▪ Hypofraktionierte Radiotherapie (40-42,5 Gy in 15-16 Frakt.)	1a	A	+
▪ Boost-RT des Tumorbettes	1b	B	+/-
▪ Bei Risikofaktoren* (absoluter Vorteil 5-J-RFS 4%, Fibroserate signifikant erhöht)	1b ^a	B	+/-
▪ Ohne Risikofaktoren	2b	B	-
▪ Teilbrustbestrahlung [Alter ≥50 Jahre, DCIS ≤ 3 cm, G1-2, R0 (\geq 5 mm), unifokal/ unizentrisch]	1b	B	+

NW und Nachteile der Radiotherapie müssen gegenüber der erreichbaren Risikoreduktion abgewogen werden. Ein Verzicht auf eine Strahlentherapie nach BEO bedeutet ein erhöhtes lokales Rezidivrisiko ohne Einfluss auf das Überleben. Dieses gilt auch für Patientinnen mit günstigen prognostischen Faktoren (low-risk-Subgruppe; Level I-Evidenz): < 2,5 cm, low and intermediate nuclear grade, mammographisch entdeckt

*< 50 J. oder ≥ 50 J. und Diagnose durch Symptomatik, ≥ 15 mm, Multifokalität, tastbarer Tumor, Resektionsränder < 10 mm, G2/3, zentrale Nekrose, Komedo-Typ

Use of anastrozole for breast cancer prevention (IBIS-II): long-term results of a randomised controlled trial

Cuzick J et al, Lancet 2020

- N = 3,864 postmenopausal women at increased risk for breast cancer,
- median follow-up of 131 months,
- results:
 - 49% reduction of all breast cancers with anastrozole (HR 0.51, 95% CI 0.39–0.66, p<0.0001),
 - significant reduction in incidence for anastrozole for ductal carcinoma in situ (HR 0.41, 0.22–0.79, p=0.0081), especially for oestrogen-positive (HR 0.22, 0.07–0.65, p=0.0062),
 - 5-year adherence anastrozole 74.6% vs. 77.0% for placebo,
 - no difference in major side effects (fractures, myocardial infarctions, deep vein thrombosis, pulmonary embolism),
 - NNT to prevent one breast cancer during 12 years: 29 (anastrozole) vs. 59 (tamoxifen).
